b. SNMP

c. SLA

d. FBI

Question 19 4 out of 4 points

Describe viruses and worms.

Selected Answer:

Both viruses and worms are types of malware/malicious code used to destroy or steal information. Viruses are code segments that are attached to existing programs and take control of access to target computers. Worms replicate themselves until they fill up available resources (such as memory and hard drive memory).

data file contains the hashed representation of the user's

Correct

Answer:

A computer virus consists of segments of code that perform malicious actions. This code behaves very much like a virus pathogen attacking animals and plants, using the cell's own replication machinery to propagate and attack. The code attaches itself to the existing program and takes control of that program's access to the targeted computer. The virus-controlled target program then carries out the virus's plan, by replicating itself into additional targeted systems.

A worm is a malicious program that replicates itself constantly, without requiring another program to provide a safe environment for replication. Worms can continue replicating themselves until they completely fill available resources, such as memory, hard drive space, and network bandwidth.
